#### APPENDIX I

#### NOTES ON STATISTICS AND STATISTICAL STATEMENTS

- General. The statistical tables in this Report may be incomplete and subject to revision. The information has been primarily derived from replies by the aid supplying countries to a questionnaire sent to all governments;
   in all, seventeen countries sent statistical replies but only three provided a memorandum covering development policies. Where statistical data provided by recipient countries differ from those given by supplying countries, the latter have been used as there has not been time to reconcile discrepancies.
- 2. Area coverage. The Commonwealth has been defined as self-governing members of the Commonwealth and associated and dependent territories as at December 1970. Where necessary, adjustments have been made to the figures for earlier years to ensure comparability.
- 3. Rounding. The addition of individual items in columns does not necessarily add to the totals given owing to rounding.
- 4. Conventional signs. The following symbols have been used:
  - nil or less than half unit shown
  - not available
  - () figures in brackets are either incomplete or Secretariat estimates.

## APPENDIX II

## Economic developments in developing countries in 1970 (prepared August 1971)

During 1970 there was a marked and widespread slowdown in economic activity affecting both developed and developing regions, industry and agriculture. The effects of the slowdown were most apparent in the United States whose decline in industrial production had repercussions on the rest of the world economy.

The search for effective anti-inflationary policies dominated the economies of most developed countries. Between 1969 and 1970 consumer prices rose by more than twice the decade average in many developed countries, with only very slight intercountry differences. Some of this inflation was inevitably reflected in world trade prices and the cost of developed countries' imports rose by 15% in 1970, although in quantum terms the increase was only 8%, i.e. slightly above the decade average.

The performance of developing countries in 1970, with gains comparable to the decade average, was barely satisfactory as the rates of growth of 1969 were not repeated.

The drop in the rate of growth of agricultural production in 1970 was particularly noticeable after the large increase of the previous year. At 2.5%, agricultural growth did, however, keep up with population increases. In the industrial sector, growth compared favourably with the average rates for the decade as a whole, but was appreciably lower than the level reached in 1969.

The developing countries in 1970 shared in the growth of world trade, although to a lesser extent than the developed countries. In value terms, developing countries' trade rose by about 11%, slightly more than in 1969, but in volume, because of unusually steep price rises, the rate of increase was slightly below that of 1969.

## PRODUCTION

The overall growth of production in developing countries tended to slow down in 1970 from the high rate achieved in 1969. It is probable that the combined G.D.P. of the developing countries after increasing by over 6% between 1968 and 1969 rose by a little over 5% between 1969 and 1970. This leaves the growth rate fractionally above the 1960-1969 average and in line with the target of the First U.N. Development Decade. Furthermore, the growth rate compares favourably with the rate of increase of world production which dropped sharply to below 4% in 1970 from an average of 5.5% a year in 1960's, mainly due to poor performance in developed market economies whose combined rate of growth dropped to about half the average of what was achieved between 1960 and 1969. The deceleration in growth rates occurred in all developing regions. In Africa, performance of agriculture was poor and there was also a decline in the rate of increase in the output of mineral based economies. In Asia and Latin America, there was a slowing down of economic activity in a number of major countries. (Argentina, Brazil, Chile and Mexico, in Latin America and India, Pakistan and the Philippines in Asia).

In line with the developing countries as a whole, Commonwealth developing countries showed a slowdown in their growth rates, but from the preliminary data available, it appears that their performance was on the whole poorer than developing countries as a group.

## Agriculture

Whereas 1969 was a year of exceptional agricultural expansion for developing countries mainly due to recovery in South and South East Asia, the growth rate in 1970 reverted to just about the decade average of about 2.5% per annum.

The deceleration in South and South East Asia was mainly due to reduced output in Cambodia, Korea and Pakistan but the high rate of growth was maintained in India and Malaysia. Agricultural production in Africa stagnated. In most West African countries poor cereal and ground-nut crops brought down output, while bad weather reduced output of maize in Zambia and Malawi. The Latin American countries regained the decade average in 1970 but, in Jamaica, Trinidad and Tobago and Guyana output was smaller, reflecting reduced sugar and coffee harvests.

Food production in the developing countries increased by 5% between 1969-1970, well above the average rate of growth for the decade. While the sharpest gains occurred in Latin America, the expansion in South and South East Asia at over 4% was well above the long term rate of growth. In Africa results were poor with Zambia, Malawi and to a lesser extent Uganda showing a decline from the trend growth (Annex Table A). The material improvement was mainly due to favourable weather at critical times in the cycle of major crops but technical advances also contributed, in particular new cereal varieties have made their biggest impact in Asian developing countries including India, Pakistan and Ceylon. Government policies in regard to tenure, availability of credit and the dissemination of information also played a significant part in some areas.

## Industrial Production

After reaching a high figure of 9% in 1969, the rate of increase of industrial production fell to just over 6% in 1970. While among the Asian countries the reduction was only fractional, the rate of increase fell to just over 4% in Latin America. Mining production which rose at an average of 8% during the decade grew at just less than 9% in 1970. But the rate of growth of the manufacturing production declined from over 9% in 1969 to 5% in 1970, with processed food production declining from 7% to 5%, textiles from 8% to 7%, paper from 8% to 5%, chemicals from 9% to less than 8%, non-metallic minerals from 10% to 7% and base metals from 14% to 2%, the sharpest fall of all. (Annex Table B).

Because of the lack of data, it is not possible to make any statement of general validity on the industrial performance of Commonwealth developing countries, but it appears that Uganda and Ceylon continued to expand their mining production, while manufacturing in Kenya expanded rapidly in 1970 though at a lower rate than in 1969.

## TRADE

1970 was a favourable year for world trade but, although the total merchandise trade of the developing countries continued to increase rapidly, their share in world trade declined further. Both exports and imports of developed market economies continued to grow faster than those of the developing countries. On the whole, most of the Commonwealth developing countries experienced the same trend as developing countries as a group, showing rapid increase in both their exports and imports.

## TABLE 2 : FOREIGN TRADE IN 1970 AND THE RATE OF INCREASE

Source: Based on the U.N. Monthly Bulletin of Statistics.

## Exports

While the exports of developing countries rose by 9% in 1970, somewhat lower than in 1969, the exports between developing countries themselves - after a vigorous growth in the period 1967 - 1969, rose by a mere 3% in 1970. This deceleration was common to all developing regions except for Africa which experienced faster growth in its exports to the developing countries as a whole, with a marked expansion in trade with Latin America. Exports of Asian developing countries to other developing countries were virtually stagnant but those to developed countries rose faster than in 1969. All developing regions showed a slow-down in growth or reduction in exports to centrally planned economies. The major part of the increase in export earnings of the developing countries as a whole arose from an increase in the volume of exports, except for Latin America where increased export prices acco unted for the larger part of the increase in value (Annex Tables C and D).

Commonwealth developing countries as a whole improved their export positions in value terms, mainly due to improvements in the exports of their major products. Ghana's exports rose by 22% in 1970 mainly due to a substantial rise in cocoa shipments. Nigerian exports rose by 37%, almost entirely due to exports of petroleum and petroleum products. Malawi's exports showed a moderate increase of 10% as a result of small rises in tea and tobacco Jamaican exports rose by 18%, but those from Trinidad and Tobago were stagnant. Indian exports rose by 5% but those of Pakistan were stagnant. Zambia's exports, heavily dependent on copper, suffered a severe blow in 1970 (exports fell in value terms by 10%), both due to a decline in copper prices and a decline in production.

## Imports

Imports of the developing countries grew at about the same rate as in 1969. While Latin America and African imports grew much faster than in 1969, West Asian imports recorded a much slower growth. For the developing countries, about two-thirds of the increase in imports can be attributed to the increased quantities imported, the rest is due to higher import prices. For Africa, however, more than half the increase in the value of imports was due to higher prices.

Imports of Commonwealth developing countries on the whole continued to rise. For Nigeria (55%), Ghana (19%) and Trinidad and Tobago (11%), this was mainly due to imports of manufactures and capital goods, but for Malawi (15%) and Pakistan (4%), this was because of higher food imports.

## Terms of Trade

For the developing countries as a group the net effect of the changes in import and export prices was a 2% worsening in the terms of trade. But in Latin America the rise in export prices was well above that in import prices, and the terms of trade improved by an average of 2.5% to a figure about 10% more favourable than that obtaining at the beginning of the 1960's. In South and South Eást Asia the price changes were more or less offsetting, leaving the average terms of trade unchanged at a level more or less equivalent to that of 1961. For Africa the rise in import prices was twice the rise in export prices and there was a 3% deterioration in the region's average term of trade, bringing the ratio in line with that at the beginning of the decade. This showed an unusual overall stability in the price ratio at which developing countries' exports and imports exchanged. The 1970 average was virtually the same as that of 1961 and within 2% of the lowest (1962) or the highest (1969).

## THE STATE OF THE ECONOMIC BALANCE

In 1970, inflationary pressures in developed countries spread and intensified, but this did not affect developing countries on the whole where price increases did not differ significantly from those of the earlier part of the decade. Furthermore, the external balance of developing countries continued to be favourable in 1970 with demand for their exports fairly buoyant. Dramatic short-term capital movements between developed countries did not have any major effect on the developing countries. However, increased debt commitments of many countries may affect their future external balance positions.

## Internal Balance

In general, price increases in developing countries during 1970 were comparable to those of the previous year and to the increases which occurred in the developed countries in 1969-70. However, aggregate figures conceal the wide variations experienced by individual countries. While most regions were favoured by good harvests and easier food prices, some areas, notably West and Central Africa, suffered poor crops, and food shortages had to be met by increased imports.

The fact that, in 1970, the proportion of developing countries which experienced consumer price rises in excess of 5% was unchanged, indicates that inflationary pressures were not significantly stronger than normal, but an unusually large part of that inflation was imported, particularly in Africa, where the unit value of imports rose by some 7%. This is a disturbing situation for those countries which have successfully made efforts to curb domestic inflation. Imported inflation has the drawback that it can only be cured at source.

To some extent, the rate of inflation was strengthened by changes in the money supply which, in slightly more than half of the seventy developing countries for which data are available, expanded by 10%. This, with the 5% increase in production, follows the pattern of recent years. The proportion of countries where the money supply increased by more than 20% was slightly higher than normal, but, on the other hand, more countries showed a decelerating rate of increase. In brief, about one-fifth of the developing countries displayed disturbingly rapid price increases in 1970. Of these, half were continuing an earlier trend.

These general observations are borne out by the experience of the Commonwealth. Of the eighteen countries for which data are available, ten showed only moderate price increases and two - Singapore and Mauritius - showed a reduction in consumer prices. Ghana experienced a decelerating rate of inflation as a result of improved production and favourable export prices which permitted an easing of export restrictions. In India, rising costs and shortages of steel, cotton and oilseeds strengthened inflationary pressures and in Nigeria, a shortage of foodstuffs contributed to the consumer price rise of 13%. (Annex Table E).

## External Balance and Liquidity

It appears from the preliminary data available that in 1970 developing countries as a group were able to finance their imports almost entirely from their exports. But this conceals the fact that petroleum exporting countries registered a trade surplus almost equal to the trade deficit of other developing countries. This contrast between petroleum exporting countries and the rest was observable in the regions concerned. In Latin America, a surplus in Venezuela offset the deficit in the rest of the region, while in Africa the large surplus of petroleum exporting countries was the main component of the region's active balance of \$ 1.8 million. The West Asian trade surplus of \$2.9 billion represents an active balance of \$ 4.2 billion of the petroleum exporting countries and the passive balance of \$1.3 billion of the rest of the region. In South and South East Asia which earn very little from petroleum exports, the 1970 deficit of about \$ 3.4 billion was rather less than that of the two previous years. In the Commonwealth, out of the eleven countries for which data are available, nine either increased their trade deficits or reduced their trade surpluses. Those countries such as India and Ceylon which registered a reduction in deficits did so mainly because of a reduction in their imports. (Annex Table F).

Developing countries as a group increased their international liquidity by about \$ 2.6 billion in the course of 1970 (\$ 2.1 billion of Special Drawing Rights are excluded). This almost doubled over the decade increasing faster than either total production or total imports, thus increasing the reserve-import ratio even further. These increases obtained in each of the regions with a marked increase in the reserve position of Africa and Latin America, both of which also saw a pronounced improvement in their reserve-import ratios.

# TADIE 6 . DECEDVES AS A DEDCENTACE OF INDODES

In Commonwealth developing countries Ghana, Nigeria and Pakistan reserves were lower in 1970 than at the beginning of the decade at 18%, 52% and 63% respectively of the 1960 level. These countries also suffered a pronounced drop in their reserve-import ratio during the decade. Malaysia, Kenya and Zambia improved their reserves dramatically, at 206% 425% and 257% of the 1960 level, and their reserve-import ratio rose markedly, particularly for Zambia which stood at 1.05 in 1970 (Annex Table G).

Developing countries as a group used \$ 371.2 million of SDR's i.e. 44% of their SDR allocations (Annex Table H). Of all the regions the greatest use was made by Asian countries with India and Pakistan using more than 60% of their allocations. Some countries such as Guyana, Ceylon, Ghana, Lesotho and Swaziland used up all their SDR allocations while others such as Jamaica, Gambia, Malawi, Uganda and Botswana made no use at all. Malaysia, Kenya and Zambia actually increased their holdings of SDR's.

One consequence of the improvement in the external balance position of developing countries was the flow of resources into the International Monetary Fund from developing countries which increased from \$ 74 million in 1969 to \$ 335 million in 1970. While gross drawings from the Fund were further reduced in 1970, repayment of earlier advances were substantially higher. Only the West Asian region increased its indebtness to the Fund, but the African region increased its drawings in 1970 and consequently net payments to the Fund declined.

## OUTLOOK FOR 1971

The latest O.E.C.D. forecasts suggest a gradual acceleration in growth of output in the developed countries whose combined potential G.N.P. growth should approach  $5\frac{1}{2}$ % by the end of 1971. However, in most countries, the acceleration of output growth depends on rapid increases in demand for private consumption and so far only limited support has come from private productive investment. Despite the intensification of inflation in the United States and United Kingdom, both Governments are inclined towards a policy of expansion, but recent changes in U.S. policy, in particular the

imposition of the 10% import surcharge are likely to reduce the expected increase in world trade below what it might otherwise have been. However, many primary commodities would not be affected by the surcharge as they are imported into the U.S. under U.S. quota arrangements, but at present it does not appear that manufactured goods from developing countries will be exempt.

The National Institute of Economic and Social Research (N.I.E.S.R.) earlier this year estimated that the developing countries would have a substantial share in any increase in world trade in 1971 although their total share in world trade might continue to decline. Primary commodity prices are expected to rise by over 3% by the end of the year so that the export earnings of the developing countries should rise, possibly enabling the developing countries to achieve the 6% per annum growth target set for the Second Development Decade. Production forecasts for the developing countries are however unreliable because of the heavy dependence on the performance of the agricultural sector which is subject to the vagaries of weather and disease. However, as a result of continuing technical advances and improved cereal varieties progress in the agricultural sector should be maintained and should make a considerable contribution to economic growth, particularly in Asia. Furthermore, the increasing government awareness of the possibility of food shortage crises has resulted in more emphasis being laid on agriculture in national development plans, especially with regard to the provision of credit and extension services.

## Annex I

## Commodity situation and outlook

The main characteristics of overall commodity price trends in 1970, as they affected the trade of the developing countries, were a further strengthening of foodstuffs prices, a downward trend in those of agricultural raw materials from April onwards, and a decline in the price of non-ferrous metals following a slight increase in the first quarter of the year.

Source: U.N. Monthly Bulletin of Statistics June, 1971.

According to the calculations of the National Institute of Economic and Social Research, the price indices of the developing countries' primary exports rose slightly in the first half of 1970 and then dropped off, but on average they were 4% higher than in 1969.

As shown in the following table, the prices of the major foodstuffs, with the exception of rice and cocoa, rose during the year by approximately 11%. Notable gains were made in vegetable oils and oilseeds, tea, sugar, bananas and - the most spectacular - coffee, which rose by 30%. On the other hand, agricultural raw materials, with the exception of cotton, declined by 9% on average. During 1970, many developed countries, including the United States, which is the world's largest single raw materials consumer, experienced strikes and a slowdown in their industrial activity. This was the main cause of the decline in prices of raw materials and metals, but a contributory factor was the generally high level of interest rates in developed countries which disuaded manufacturers from accumulating or holding stocks. The situation was aggravated by the fact that the high prices of 1969 had stimulated overproduction of some commodities.

During the year, the prices of the main non-ferrous metals with the exception of aluminium, tended downwards although only copper, with a fall of 4%, was lower than in 1969.

## Export Price Indices of Primary Commodities 1967 to First Quarter of 1971

In general it seems likely that there will be some recovery in world import demand for primary commodities in 1971, particularly for nonfood products. However, because of time lags, the effect on export earnings may not become apparent until late in the year. There will be, moreover, some variation in the situation between commodities depending on the balance between supply and demand for individual products.

A review of the situation and outlook for selected primary commodities produced in the Commonwealth is contained in the following sections.

## Agricultural Food Products

## Rice:

There have been as yet no improvements in the conditions which led to a downturn in rice prices in early 1968 and rice prices remained depressed throughout 1970. As world paddy production in the 1969/70 season reached record levels, quantities available for export increased considerably but at the same time, record crops in India, Ceylon and South Korea reduced demand from these traditional importers and on balance, rice exports showed no increase in 1970. Furthermore, Japan, traditionally a net rice importer, became a net exporter. Significant changes in the situation are unlikely in the near future. Although exporting countries are now restricting production, improved varieties and better methods of cultivation result in higher crop yields.

### Sugar:

During 1970, for the second successive year, the International Sugar Agreement operated with export quotas at 90% basic tonnage. World production of sugar in the 1969/70 season reached 73 million metric tons, an increase of 5 million over the previous year. Notable gains were made in India and Pakistan. Consumption continues to rise annually by about 3.5%, mainly in Asia.

The price of sugar on the free market rose consistently through the year and in December 1970 reached its highest level since 1964. On average, 1970 prices were 15% higher than those of 1969. With the price rise continuing into the early months of this year and with prospects of a tighter demand/supply position developing, export quotas for 1971 were set at 100% under the Agreement for the first time.

## Bananas:

As a result of the 1969 hurricane damage to the Central American banana crop, the world supply situation in early 1970 was tight and prices rose, but towards the end of the year the supply situation eased and world trade in bananas for 1970 increased by 1%.

### Coffee:

During the 1969-70 season, the prices for all four types of coffee specified by the International Coffee Authority remained high, occasionally exceeding the I.C.A. ceilings. The strength of prices resulted from the unfavourable outlook in Brazil where frost, drought and leaf-rust disease were expected to reduce the harvest. It was this expectation of reduced production which kept prices up when the 1970/71 season opened in October 1970. Export quotas were raised to 54 million bags with 4 million bags in reserve, but by February 1971 prices were falling and the quotas were reduced. By April, however, prices had recovered. Estimates suggest that total world production for the current season will be low - 57.9 million bags, although in East Africa the crop is expected to increase as a result of improvements in the control of coffee berry disease.

## Tea:

The consistent downward price trend which has characterised world tea markets during the last decade, was halted in 1970, largely as a result of the decision to remove from the world market 90 million pounds of black tea and to restrict exports. Although there was some improvement, prices were still below 1967 levels.

During 1970, production gains were recorded in North and South India and prices for the top Indian grades were strong. Poor weather reduced output in Ceylon but high levels of production were maintained in Uganda, Tanzania and Malawi and output rose significantly in Kenya.

Tea sales at the London Auctions dropped in volume, but U.K. stockbuilding and increased demand from the Middle East pushed prices up on average to 12% more than in 1969.

The widening gap between tea production and consumption is the most pressing problem for the future and the need for limitations on new plantations is becoming apparent. New campaigns to promote consumption are necessary although, for the present, the high coffee prices will have some favourable effect on the tea market. Any major increases in consumption must, however, come from the producing countries themselves. India, for instance, with its large population could make a considerable impact on the market by increasing per capita consumption by even a very small amount.

## Cocoa:

Throughout 1970, cocoa prices, influenced by crop scares and reports of changed sales policies in producer countries, fluctuated between new lows and new highs.

Production in 1970 reached 1,416,000 tons, an increase of approximately 200,000 tons over 1969, African production in particular rose. World consumption of cocoa fell in 1970 and for the first time in five years, production exceeded consumption. As a result, after four successive annual price increases, cocoa prices fell by 25% in 1970.

In April 1971, the Statistical Committee of the F.A.O. study group on cocoa predicted that the increase in production in 1971 would be proportionately smaller than the expected recovery of consumption, but nevertheless, a small cocoa surplus is expected in 1971.

## Vegetable Oils and Oilseeds:

World production of vegetable oils and oilseeds in 1970 is estimated at 23.5 million tons, i.e. a rise of 5% over 1969. The coincidence of strong demand for edible oils from importing countries and a tight supply situation pushed prices up. Price increases for the main vegetable oils ranged from 9% for coconut oil to 55% for sunflower oil; copra increased by 10%, soya bean oil by 46% and palm oil exceeded its 1969 price by 44% at its highest price since 1956. Prices of groundnut and groundnut oil rose by 11% and 14% respectively as West African production declined. Although groundnut production in India increased, most of the additional crop was consumed domestically.

Commonwealth vegetable oil production improved to 4.4 million tons. Malaysian exports increased with growth in palm oil output. Nigerian palm oil production rose but most of the increase was absorbed by the domestic market.

In the first four months of 1971, prices of all the major oilseeds levelled off, reflecting the expectation that, although demand would remain high, the supply situation would improve later in the year.

## Agricultural Raw Materials

### Cotton:

World cotton production in 1969/70 at 51.5 million bales (480 lbs.) was 4% down on 1968/69 and only a slight improvement is forecast for 1970/71. Consumption of cotton rose to a record 53 million bales in 1969/70 and should increase by about 1% in 1970/71. Consumption may fall slightly in the developed countries but modest gains are expected in some developing producer countries as local textile industries are encouraged.

Cotton prices during the first few months of 1970 were hesitant but strengthened through the remainder of the year and into the early part of 1971. On average in 1970, medium staples increased by 4% and long and very short staples, which were in short supply, rose further in price.

Despite competition from synthetic fibres, world demand for cotton maintains a steady growth which is expected to continue for the eighth successive year in the 1970/71 season, but recent anti-inflation policies in many countries may temporarily curtail expansion, particularly in the U.S.A. However, increased cotton usage is expected in Asia in 1970/71, possibly necessitating a drop in stocks. This situation should give rise to firmer prices to the limit of competition from synthetics.

### Sisal:

Following the collapse in February 1970 of the informal international quota and minimum price arrangements for sisal and henequen, there was a marked decline in prices which continued through the year till October when the average price of the indicative grade was down by 12%. Since October, with African stocks reduced and output affected by poor weather, prices have recovered considerably. The outlook is again more hopeful following the meeting in May 1971 of the F.A.O. Consultative Sub-committee on Hard Fibres when agreement was reached by producing countries on a new distribution of export quotas for sisal and henequen, thus re-establishing the informal arrangements for market sharing.

### Jute:

The 1969/70 jute season witnessed a recovery from the poor performance of the previous season, but the low carry-over stocks and

greater mill capacity in Pakistan created a tight supply situation for raw jute, and between March and June 1970 prices were pushed above the recommended ceiling. In July, Pakistan introduced a bonus scheme on raw jute exports enabling export prices to return within their recommended limits. On average, 1970 prices were 4% lower than in 1969.

The outlook for jute in 1971 depends on the rate of return to normal conditions in East Pakistan and on the ability of producers to withstand competition from synthetics.

## Rubber:

Prices of agricultural raw materials in 1970 were generally weak and rubber was no exception. On average prices were 19% lower than in 1969. This decline reflected a slump in demand from the developed countries mainly due to short term factors, viz., the slow-down of economic activity in the U.S.A. and strikes in the automobile industries of North America and the United Kingdom. The likelihood of a price recovery in 1971 is limited. Although demand for rubber is increasing as industrial expansion is renewed in the United States, high stocks remain in South East Asia and there is a possibility that the U.S. Government may sell from its strategic stockpiles. More disturbing is the long term threat from synthetics.

### Non-Ferrous Metals

## Copper:

In 1970, there was a change in the situation of recent years when there has been a metal shortage following the 9-month U.S. strike of 1967/68, supplies rose as world mine production reached record limits. Throughout 1969 and early 1970 copper prices were held firm by the high level of demand from Japan and the Communist Bloc, but by April, prices were moving downward. On average, for the year, the London Metal Exchange price was 4% lower than in 1969. Among the main factors underlying the decline were the slowdown in the United States economy, sales of excess stocks in Japan, the high level of stocks held in London and the removal of the obligation on American producers to lay aside part of their output for national defence purposes. The downward trend outweighed the effect of stoppages in Chilean mines and the reduced output of Zambian mines as a result of the Mufulira disaster.

Copper consumption in 1970 was, on balance, unchanged, the drop in U.S. consumption being offset by an increase in European.

Copper prospects for 1971 depend largely on the extent of the economic recovery in North America and on whether the threatened U.S. copper workers' strike takes place. The market may be strengthened by the U.S. Government buying to replenish its stockpiles which are allegedly low.

## Tin:

In 1970, world tin supplies were well above the estimates made at the end of 1969. Consumption remained unchanged and the shortfall in supply was made up from commercial stocks and a reduction in buffer stocks.

Tin prices fell between January and July and November and December. In mid-year the market became unsettled by reports of possible sales by the U.S. Government from its strategic stockpiles. When it was announced that there would be no such sales, L.M.E. tin prices (cash metal) rose by £80 per ton. Annex II
